

Skybox® Change Manager

Firewall change requests workflow application

Description

Skybox Change Manager adds complete change workflow capabilities to Skybox Firewall Assurance. With Change Manager, firewall administrators can centrally manage firewall change requests. End-users can submit requests to allow new connectivity in the network and Change Manager quickly finds the relevant firewalls, assesses for security risks, verifies that the appropriate firewalls access has granted. The Change Manager module can also check that a request complies with network policies, and help plan the details of access rule changes.

Features

- Web-based workflow application
- Full ticketing system — including multiple phases, audit-log, comments, attachments etc.
- Automatically finds the relevant firewalls for each source, destination and port
- Checks actual connectivity by simulating the firewall access list to prevent redundant firewall changes
- Checks policy compliance requests against out-of-the-box or customized policies
- Automatic email notifications
- Allows integration with 3rd party ticketing systems

Specifications

Skybox Change Manager is an add-on module available only to customers with the Skybox Firewall Assurance solution.

About Skybox Firewall Assurance

Skybox Firewall Assurance allows network managers to quickly assess their firewall compliance status in a fraction of the time of manual audits, reducing the costs associated with firewall administration. Firewall Assurance pinpoints conflicting firewall rules and misconfigurations, potential risk exposures that need immediate attention.
